Sinhgad College of Engineering, Pune, India

Abstract: *The paper investigates the potential of leveraging new technology to develop an intelligent Virtual Assistant that utilizes natural language processing and user-based data. It analyzes existing intelligent programs across various support categories and assesses the potential utility of a specific software as a Virtual Assistant. The envisioned Virtual Assistant is expected to possess social communication abilities through natural language processing, the capability to store and analyze user data, and the capacity to operate autonomously without human input or programming requirements. The paper suggests that advancements in technology may pave the way for the realization of virtual personal assistants. The authors conducted experiments on a particular software and conducted user testing, which demonstrated the feasibility of a basic program incorporating natural language processing algorithms. Overall, the paper presents the concept of an intelligent Virtual Assistant that has the potential to revolutionize our interaction with technology*

Keywords: The provided keywords relate to the development and technology associated with virtual assistants. They cover a wide range of topics, including the Python programming language, Natural Language Processing (NLP), the Wolfram Alpha API, desktop assistants, machine learning, text-to-speech, speech-to-text, language processing, voice recognition, artificial intelligence, Internet of Things (IoT), and virtual assistants. If you have a particular subject or query in mind, I'm here to assist you by leveraging these keywords.
