Abstract: *This project aims to analyze the intricate relationship between area and population density using data science techniques. By leveraging various datasets and employing statistical models, we delve into the dynamics of density and uncover patterns, trends, and insights. Through this analysis, we shed light on the intricate interplay between the spatial distribution of population and the geographic dimensions, ultimately providing valuable insights for urban planning, resource allocation, and sustainable development.*

Keywords: Density dynamics, area, population, data science, spatial distribution, urban planning, resource allocation, sustainable development
