Abstract: *Expense Tracker* A company expense tracker is developed using the React JavaScript library. The app allows employees to log and track their business expenses, including the cost, date, and details of each expense. The app's user interface was designed to be user-friendly, with clear input fields and an organized layout for displaying expenses entries. To build the app, we use a variety of tools and technology including React components, the fetch function, and a backend service for storing and retrieving data. We also have to implement form validation and error handling to ensure the accuracy and completeness of the expense data. In addition to the core expense tracking functionality, we added several additional features, such as the ability to filter and sort expense entries and the option to generate reports of total expenses by category or date range. Overall, the expense tracker app is a useful tool for employees to manage their business expenses.

Keywords: Updating the expenses, Altering the expenses, Accepting the requests, Allotting the money
