Abstract*: An Instasgram clone app is a software application designed to replicate the features, functionalities, and user experience of the popular social media platform Instagram. Essentially, it mimics the core aspects of Instagram, such as photo and video sharing, user profiles, likes, comments, direct messaging, and social interactions, with the aim of providing a similar experience to users but often with some customization or additional features. These clone apps are typically developed by third-party developers or companies seeking to capitalize on the success and popularity of Instagram by creating their own version of the platform.*
