Abstract: *In India, patient autonomy and informed consent are fundamental legal principles in medical treatment¹. The law presumes the doctor to be in a dominant position, necessitating comprehensive disclosure of information to obtain valid consent from competent patients². When conducting research or forming hypotheses on this complex issue, historians should evaluate source credibility and determine which secondary sources are reliable³. For incompetent patients, consent protocols involve guardians or attendants⁴. While courts emphasize informed consent, the quantum of required information remains unclear^{15[6]}. In emergencies, doctors have a duty to preserve life, even without consent, though the law is evolving on competent patient refusals.¹*
