Abstract: *Organ Donation Day is observed each year on the thirteenth of August. Because of the absence of mindfulness, there are fantasies and fears in peoples minds about organ gift. The point of this day is to spur typical individuals to promise to give organs after death, and to spread mindfulness about the significance of organ donation. Organ Donation is giving a giver's organs like heart, liver, kidneys, digestive tracts, lungs, and pancreas, after the benefactor kicks the bucket, to transplant them into someone else who needs an organ. Organ gift is characterized as "When an individual permits an organ of theirs to be evacuated, lawfully, either by assent while the benefactor is alive or after death with the consent of the following of the family." Common transplants after organ gifts incorporate kidney, heart, liver, pancreas, digestive organs, lungs, bones, bone marrow, skin, and cornea. Albeit a few organs, for example, kidney and tissues like a piece of the liver, pancreas, lungs, and digestive tracts can be given while the giver is alive, the vast majority of the gifts happen simply after the benefactor's passing. In India, the administrative establishment for mind demise and organ gift was formally settled, under Transplantation of Human Organs Act, 1994 changed in 2011. It gave a genuinely necessary legitimate and straightforward framework for organ gift. Safeguarding of human life is of foremost significance. 'Right to life' under article 21 of the Indian Constitution has been translated as not unimportant physical presence but rather likewise the personal satisfaction in its greatest playfulness including the 'right to wellbeing'. Also, 'right to wellbeing' of individuals experiencing end-stage organ disappointment is by and large considerably improved through organ transplant innovation. The Transplantation of Human Organs and Tissues Act, 1994 can possibly enhance the situation of such individuals by directing organ transplants in India.*
