Abstract: *Facial wrinkles and skin aging are often caused by sun damage and UV rays, and there are currently no effective methods to slow down the aging process. Aloe Vera, glycerin, and honeybee venom are key ingredients in a concentrated face serum that helps improve skin health. Aloe Vera provides quick cosmetic benefits and also has psychological effects. The serum is easily absorbed and can penetrate deeper layers of the skin. Aloe Vera is known for treating skin issues like sunburns, minor cuts, and insect bites, and it has healing, anti-inflammatory, antibacterial, and antifungal properties. Bee venom, a toxin produced by bees, is believed to help improve blood flow and increase collagen production. The face serum was tested for its quality, including pH, consistency, and size of the droplets. Stability tests showed that the serum maintained its appearance, texture, and consistency without any changes.*
