Abstract: *Today, humanity uses various products to enhance beauty and elegance and look youthful and attractive. In mammalian systems, hair follicles are known to be the most important organs that determine appearance and sexual differentiation and strong thermal protection and protection. This generation is beginning to suffer from extreme hair loss. This is due to many life-related changes such as: Examples: using different hairstyling/coloring styles, eating junk food, fatigue, etc. Hair is one of the most important parts of the body with protective functions. The main objective of the current research is to develop an herbal hair serum for general purpose only. Herbal supplements are still commonly used by average people because they have fewer side effects are less safe, and have less protective effects. Current reviews found the herbal formulation to be effective in improving hair consistency. Average citizens still use herbal preparations for lower side effects and safety profile and lower protection. A current review has shown that herbal preparations are effective in increasing hair consistency.*
