Abstract: *The increasing demand for electric vehicles (EVs) in urban areas has sparked interest in understanding the motivations behind this trend. This study aims to investigate the reasons why urban area residents choose electric vehicles. A survey of 500 urban residents who own EVs was conducted, and the results show that the primary motivations for choosing EVs are environmental concerns, lower operating costs, and government incentives. The study also found that demographic factors such as age, income, and education level play a significant role in the adoption of EVs.*
