Abstract: *The increasing need for streamlined financial processes in small businesses and freelance services has heightened the importance of efficient billing systems. This paper presents "Paavti Pustak," an Invoice Application that leverages a web and mobile interface to automate and simplify invoice generation, delivery, and tracking. The system addresses challenges associated with manual billing, such as time inefficiency, error susceptibility, and lack of real-time monitoring. Paavti Pustak provides a timely alternative by enabling users to generate, send, and manage invoices online. The application features electronic bill delivery options, including PDFs and website displays. Experimental implementation demonstrates enhanced workflow efficiency through automated payment computation and improved customer experience via integrated billing and banking functionalities*
