Abstract: *The Online Marriage Registration System is a digital platform designed to simplify and streamline the process of marriage registration for citizens. It allows users (bride and groom) to apply for marriage registration online by filling out forms, uploading necessary documents, and scheduling appointments with the registrar, all through a user-friendly web interface.*

The system eliminates the need for physical visits and paperwork by offering a seamless digital workflow. After submission, the application is verified and processed by administrative staff through a secure backend portal. Once approved, the marriage certificate can be generated and made available for download.

This system not only enhances transparency and efficiency but also ensures proper record-keeping and reduces the administrative burden on government offices. It provides real-time status updates, data security, and convenience to all stakeholders involved
