**Abstract:** *The main objective of this project is to facilitate the basic concept of parenteral preparation, area planning, general requirements, formulation of parenteral preparation, evaluation of parenteral preparation. Parenteral preparation gives quick onset of action so it is useful in emergency cases. Compare to other dosage forms parenteral preparation are efficient. Typically a sterile drug contains no viable microorganisms and is non-pyrogenic. Drugs for intravenous injection for irrigation and those used as ophthalmic preparations meet these criteria. In addition, other dosage forms might be labeled as sterile, for instance an ointment applied to a puncture wound or skin abrasion.*

**Keywords:** Parenteral Drug Delivery, Sterilization, Route of Administration.
