Abstract: *The growth of Non-Governmental Organizations (NGOs) has led to the need for efficient research management solutions. This paper presents the design and development of a web-based NGO Research Management System (NRMS) aimed at streamlining research activities, resource management, volunteer coordination, and reporting. The system enables NGOs to track research projects systematically, manage donor information, coordinate volunteer activities, and generate insightful reports. Using technologies like Django and PostgreSQL, the platform ensures transparency, enhances operational efficiency, and provides scalability for future enhancements.*

Keywords: NGO Research, Resource Management, Research Project Tracking, Volunteer Coordination, Django Framework
