Abstract: *Inventory management systems are crucial for businesses of all sizes, as they help track the stock of goods and materials, ensuring they are always available when needed. However, managing inventory manually can be time-consuming, error-prone, and inefficient, leading to issues like stockouts or overstocking. The emergence of web-based inventory management solutions has transformed how businesses track, manage, and optimize their stock levels. This research aims to develop a web-based IMS that improves inventory accuracy, reduces operational costs, and enhances overall business efficiency.*
