Abstract: *Most of the time, the humans live in peaceful coexistence with the microorganisms that surround them. An infection may emerge only when the defence system is damaged or the concentration of pathogens reach an exceptionally high density. Most infections remain unrecognized but sometimes the infecting agents do elicit a response of the body, which leads to clinical signs and symptoms, a condition known as infectious disease. As strategies to control bacterial infections in patients improved, fungi became the most hazardous pathogens.[1].*

Keywords: *defence system*
