Abstract: *Access to legal services is a major challenge for many common people in India due to high lawyer fees, lack of legal awareness, and complex legal procedures. Many individuals do not understand their rights or the legal steps required to resolve their issues. To address this problem, this paper presents AI Lawyer – Smart Legal Support for Common People.*

The proposed system uses Artificial Intelligence to provide basic legal guidance through a digital platform. The system allows users to ask legal questions related to common issues such as property disputes, cybercrime, consumer rights, family law, and basic legal procedures. The AI-based system analyzes the user query and provides simplified legal information and suggested steps.

The system also includes features such as legal document guidance, case information, and awareness about government laws and rights. By using AI technology, the platform makes legal knowledge more accessible, affordable, and understandable for common people. This solution helps bridge the gap between legal professionals and citizens while promoting legal awareness and digital justice support.
