Abstract: The volume of data contained in instructional datasets is growing fast in today's environment. These datasets contain information regarding the performance and progress of students. The presentation of higher education in India is a pivotal moment in academics for all students. This academic exhibition is impacted by various circumstances; thus, it is crucial to develop a proactive information gathering strategy for students' presentation in order to differentiate between high-achieving students and underperforming students

Keywords: Data Mining, Educational Data Mining, Predictive Model, Classification
