**Abstract:** *The role of pharmacists in healthcare is undergoing transformation throughout the world. The Continuing Professional Development (CPD) model has motivated the pharmacists in the developed Countries to adopt lifelong learning. This is vital to improve competence and to optimize patient care. Pharmacists as one of health care providers face ethical issues in terms of pharmaceutical care, relationship with patients and Cooperation with the health care team. Other than pharmacy, there are pharmaceutical companies in various fields of manufacturing, Importing or distributing that have their own ethical issues. In addition, the future of pharmacy practice and clinical roles of hospital and community pharmacists were reviewed. It was realized that pharmacy practice and progress in many of the Arab and African countries were a mirror image of the status of the country itself. A new vision for the future of pharmacy practice needs to be considered and reorientation of pharmacy services in the existing system is needed. There should be a professional approach to speed up the rise towards practicing clinical pharmacy and pharmaceutical profession. This is achieved by interviewing patients, documenting their health details and educating them on methods of improving their health, including proper medication usage and lifestyle modification. Furthermore, colleges of pharmacy need to revise and update their curricula to accommodate the progressively increasing development in the pharmaceutical education and the evolving new roles of practicing pharmacists in their community.*

**Keywords:** Pharmacist Profession, Achievement of Pharmacist, Global Industry
