Abstract: *It is said that in an Indian education, a student's marks decide the outcome and not the skill and it's very true. Indian Education system is intense more on the marks that a student has acquired rather than giving importance to the skill or competency that has been built. Rather than training the student and imparting long lasting knowledge, the education system is fixated on the student's retention and rote learning abilities. Even the examinations are based on the same value. The curriculum of schools and higher educational institutions is also based around clearing an exam and getting a job rather than all round and skill development of student. Learning is secondary. This research paper focuses on how Indian Education system is heavily dependent on marks and learning rather than skill development and creating competency.*

Keywords: Competency, retention powers, rote learning
