Abstract: Android and E-commerce applications are tools for accessing the Internet and purchasing products and services. These applications are constantly evolving due to advanced technological advances. This document provides a new perspective on the types of applications that can be used. It describes and analyzes device requirements, provides a literature review on key aspects of android devices capable of using such applications, and provides requirements for websites designed for Woo-commerce. Aspects of mobile device design and security are also considered. This paper also examines the characteristics and potential of the cross-mobile platform application Phone Gap as an alternative to existing Woo-commerce applications. This result suggests that effective android applications exist for various smartphones, and web applications should be effective on android devices. You can use the Android Simulator to verify proper functionality and compile your application, but for this project we have personally used expo-go app as an emulator.

Keywords: woo-commerce; phone gap; android; react-native ; expo app
