Abstract: *There is a great saying that a good book is a good friend. Reading books can help human to improve one's intelligence and is also a good exercise to the brain. So reading book habits have many advantages. The traditional method of reading books has its own advantages, but it consumes not only a lot of time and money but also a lot of space. They require more time to complete a book. Unlike the traditional methods, there are also audio podcasts available in the market which take only a few hours to complete a book but are also very distracting. The users of audio podcasts can be easily distracted by anything and hence they may lose track of the actual message in the book. Thus, our idea is to provide users with a new era of digital library where multiple options are available to them. They can choose to read a book, listen to its audio, or select the read and listen option where our system reads the book for them with highlighted text, so they pay full attention to the book and the audio playing. The users can read a book as a pdf or listen to the audio of the books or can even select an option such as read and listen where our system reads the book for the user with highlighted text so that the user pay full attention on the book and the audio playing. This requires users to pay full attention to the book, and keeps them concentrated. The chances of distraction in this type of reading are very few, and hence users can get the full benefit from the book. This method can also help users complete more books in less time. Our goal is to provide every book lover with a new learning experience and give them a satisfactory experience in reading a book.*
