#### Abstract

This paper aims at determining non-zero distinct integer solutions to the non-homogeneous ternary cubic equation $5\left(\mathrm{x}^{2}+\mathrm{y}^{2}\right)-6 \mathrm{xy}=\mathrm{z}^{3}$. Various choices of integer solutions are exhibited.

Keywords: Ternary Cubic, Non-Homogeneous Cubic, Integer Solutions

## I. INTRODUCTION

The Diophantine equations are rich in variety and offer an unlimited field for research [1-4]. In particular refer [5-27] for a few problems on ternary cubic equation with 3 unknowns. This paper concerns with yet another interesting ternary cubic diophantine equation with three variables given by $5\left(x^{2}+y^{2}\right)-6 x y=z^{3}$ for determining its infinitely many non-zero distinct integral solutions.

## II. METHOD OF ANALYSIS

The non-homogeneous ternary cubic equation to be solved is

$$
\begin{equation*}
5\left(x^{2}+y^{2}\right)-6 x y=z^{3} \tag{1}
\end{equation*}
$$

To start with, observe that (1) is satisfied by the triples given by

$$
\begin{aligned}
& (x, y, z)=\left(12 \alpha^{3 k}, 4 \alpha^{3 k}, 8 \alpha^{2 k}\right),\left(a\left(5 a^{2}+5 b^{2}-6 a b\right) \alpha^{3 t}, b\left(5 a^{2}+5 b^{2}-6 a b\right) \alpha^{3 t},\left(5 a^{2}+5 b^{2}-6 a b\right) \alpha^{2 t}\right) \\
& \left((2 s-1)\left(2 s^{2}-4 s+4\right),(2 s-3)\left(2 s^{2}-4 s+4\right), 2\left(2 s^{2}-4 s+4\right)\right)
\end{aligned}
$$

However, there are other choices of integer solutions to (1) that are illustrated below:
Illustration 1:
Introduction of the linear transformations

$$
\begin{equation*}
x=4 u+2 v, y=4 u-2 v, z=4 w \tag{2}
\end{equation*}
$$

in (1) leads to

$$
\begin{equation*}
\mathrm{u}^{2}+\mathrm{v}^{2}=\mathrm{w}^{3} \tag{3}
\end{equation*}
$$

which is satisfied by

$$
\begin{equation*}
\mathrm{u}=\mathrm{m}\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right), \mathrm{v}=\mathrm{n}\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right), \mathrm{w}=\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right) \tag{4}
\end{equation*}
$$

In view of (2), the corresponding integer solutions to (1) are as follows:

$$
\mathrm{x}=(4 \mathrm{~m}+2 \mathrm{n})\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right), \mathrm{y}=(4 \mathrm{~m}-2 \mathrm{n})\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right), \mathrm{z}=4\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right)
$$

Note 1:
Observe that (3) is also satisfied by

$$
\mathrm{u}=\mathrm{m}\left(\mathrm{~m}^{2}-3 \mathrm{n}^{2}\right), \mathrm{v}=\mathrm{n}\left(3 \mathrm{~m}^{2}-\mathrm{n}^{2}\right), \mathrm{w}=\left(\mathrm{m}^{2}+\mathrm{n}^{2}\right)
$$

The corresponding integer solutions to (1) are given by

$$
\mathrm{x}=4 \mathrm{~m}\left(\mathrm{~m}^{2}-3 \mathrm{n}^{2}\right)+2 \mathrm{n}\left(3 \mathrm{~m}^{2}-\mathrm{n}^{2}\right), \mathrm{y}=4 \mathrm{~m}\left(\mathrm{~m}^{2}-3 \mathrm{n}^{2}\right)-2 \mathrm{n}\left(3 \mathrm{~m}^{2}-\mathrm{n}^{2}\right), \mathrm{z}=4\left(\mathrm{~m}^{2}+\mathrm{n}^{2}\right)
$$

Note 2:
(3) is written as

$$
\begin{equation*}
u^{2}+v^{2}=w^{3} * 1 \tag{5}
\end{equation*}
$$

Consider the integer 1 on the R.H.S. of (5) as

$$
\begin{equation*}
1=\frac{\left(p^{2}-q^{2}+i 2 p q\right)\left(p^{2}-q^{2}-\mathrm{i} 2 p q\right)}{\left(\mathrm{p}^{2}+\mathrm{q}^{2}\right)^{2}}, \mathrm{p} \geq \mathrm{q} \geq 0 \tag{6}
\end{equation*}
$$

Substitute (6) and the value of w given by (4) in (5). Employing the method of factorization \& equating the real and imaginary parts, the values of $u, v$ are obtained. Replacing
$m=\left(p^{2}+q^{2}\right) M, n=\left(p^{2}+q^{2}\right) N$ in the values of $u, v, w$ and using (2), the corresponding integer solutions to (1) are given by

$$
\begin{aligned}
& x=\left(p^{2}+q^{2}\right)^{2}\left[\left(M^{3}-3 M N^{2}\right)\left(4 p^{2}-4 q^{2}+4 p q\right)+\left(3 M^{2} N-N^{3}\right)\left(2 p^{2}-2 q^{2}-8 p q\right)\right] \\
& y=\left(p^{2}+q^{2}\right)^{2}\left[\left(M^{3}-3 M N^{2}\right)\left(4 p^{2}-4 q^{2}-4 p q\right)+\left(3 M^{2} N-N^{3}\right)\left(-2 p^{2}+2 q^{2}-8 p q\right)\right] \\
& z=4\left(p^{2}+q^{2}\right)^{2}\left(M^{2}+N^{2}\right)
\end{aligned}
$$

Illustration 2:
Introduction of the linear transformations

$$
\begin{equation*}
x=u+v, y=u-v, z=2 w, u \neq v \neq 0 \tag{7}
\end{equation*}
$$

in (1) leads to

$$
\begin{equation*}
u^{2}+4 v^{2}=2 w^{3} \tag{8}
\end{equation*}
$$

Take W as

$$
\begin{equation*}
\mathrm{w}=4\left(\mathrm{a}^{2}+\mathrm{b}^{2}\right) \tag{9}
\end{equation*}
$$

The integer 2 on the R.H.S. of (8) is taken as

$$
\begin{equation*}
2=(1+i)(1-i) \tag{10}
\end{equation*}
$$

Substituting (9) \& (10) in (8) and employing the method of factorization, consider

$$
\mathrm{u}+\mathrm{i} 2 \mathrm{v}=(1+\mathrm{i})(2 \mathrm{a}+\mathrm{i} 2 \mathrm{~b})^{3}
$$

Equating the real and imaginary parts in the above equation, the values of $u, v$ are obtained.
In view of (7), the corresponding integer solutions to (1) are as follows:

$$
\begin{aligned}
& x=12 a^{3}-36 a b^{2}-12 a^{2} b+4 b^{3} \\
& y=4 a^{3}-12 a b^{2}-36 a^{2} b+12 b^{3} \\
& z=8\left(a^{2}+b^{2}\right)
\end{aligned}
$$

Note 3:
In addition to (10), the integer 2 on the R.H.S. of (8) is expressed as exhibited below:

$$
2=\frac{(7+i)(7-i)}{25}, \frac{(1+7 i)(1-7 i)}{25}
$$

Following the above procedure , two more sets of integer solutions to (1) are obtained.
Note 4:
Consider (8) as

$$
u^{2}+4 v^{2}=2 w^{3} * 1
$$

The repetition of the process as in Note 2 of Illustration 1, one obtains a different set of integer solutions to (1).

## III. CONCLUSION

An attempt has been made to obtain non-zero distinct integer solutions to the non-homogeneous cubic diophantine equation with three unknowns given by $5\left(x^{2}+y^{2}\right)-6 x y=z^{3}$. One may search for other sets of integer solutions to the considered equation as well as other choices of the third degree diophantine equations with multi-variables
